C;Comment: Thrombin can cleave the amino-terminal activation peptide 1 from prothromb c;Comment: The gamma-carboxyglutamyl residues bind calcium ions, result from the carb cicomment: The gamma-carboxyglutamyl residues bind calcium ions, result from the carb ent interaction with the negatively charged phospholiphid membrane surface.
C;Comment: The prothrombin precursor is synchesized in the liver.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                            May 12, 2003, 15:38:52; Search time 19.4 Seconds (without alignments) 47.436 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 4, Al Sequence 5, Al Sequence 6, Al Sequence 3, Al Sequence 3, Al Sequence 5, Al Sequen

Publication No. US20020187933A1

GENERAL INFORMATION:
APPLICAMT: Carney, Darrell H.
TITLE OF INVENTION: METHODS OF THERAPY WITH THROMBIN DERIVED
TITLE OF INVENTION: PEPTIDES
FILE REFERENCE: 3033.1000-008
CURRENT APPLICATION NUMBER: US/10/050,611
CURRENT PILING DATE: 2002-01-16
PRIOR PELING DATE: 2001-07-12
PRIOR FILING DATE: 2001-07-12
PRIOR FILING DATE: 2001-07-12
                                                                                          APPLICANT: Yang, Jinping
APPLICANT: Redin, William R.
TITLE OF INVENTION: Stimulation Of Bone Growth With Thrombin
TITLE OF INVENTION: Peptide Derivatives

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a method of stimulating bone growth at a site in a subject in need of osteoinduction. The method involves administering an agonist to stimulate bone growth at a site in a subject (e.g. a farm animal, companion animal or laboratory animal), in need of osteoinduction, such as the site in need of a bone graft in a subject, a segmental bone gap, a bone void or a non-union fracture. This sequence represents a serine esterase conserved sequence obtained from a serine esterase that can stimulate or activate the non-proteolytically
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Serine esterase; osteopathic; thrombin; receptor; agonist; bone growth stimulation; osteoinduction; farm animal; companion animal; laboratory animal; bone graft; segmental bone gap; bone void; non-union fracture.
                                The invention relates to a method of stimulating growth and repair of cartilage. The method involves administering to the site, an agonist of non-proteolytically activated thrombin receptor (MRAR). The method is used in human or veterinary medicine for the treatment of arthritic joints and damage/loss of cartilage caused by traumatic injury. Also chondrocytes may be cultured in presence of NPAR agonist to provide cells for implantation at sites requiring growth/repair of cartilage. The present sequence is serine esterase conserved peptide. This sequence—is present in the thrombin peptide derivatives which serve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Stimulating bone growth at a site in a subject in need of osteoliduction, such as a site of bone graft, segmental bone gap, bone void or non-union structure, by administering agonist of activated thrombin receptor
                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present peptide comprises a thrombin-derived serine esterase conserved sequence that is used in a claimed method for promoting cardiac tissue repair. The method involves administering an angiogenic thrombin-derived peptide, especially a thrombin receptor binding domain comprising the 4-amino acid peptide given in AANSOBS6 together with the serine esterase conserved sequence, or preferably the peptide given in AAMSOBS8, which includes both these peptide sequences. The thrombin-derived peptide is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   these peptide sequences. The thrombin-derived peptide is administered during or following cardiac surgery by injection into cardiac tissue, and may be formulated as a sustained release formulation. It is used in claimed methods of stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Serine esterase; thrombin; revascularisation; vascular occlusion; tissue repair; vulnerary; vasotropic; cardiant; angiogenesis; restenosis; therapy; enzyme; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Serine esterase conserved sequence used in cardiac tissue repair.

contains a peptide immobilised to a base which consists of a contains a peptide immobilised to a base which consists of a bylogaccharide gel such as alginic acid. Sequences AABI2886-B12899 represent examples of the peptides used in the nerve regeneration material. The peptide containing material causes nerve cell repositions and also causes axonal extension. The material can be used for the treatment of central or peripheral nervous system disorders, spinal disorders, head injury or cerebrovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New synthetic neutrophil cell chemotactic peptides, useful for generating antibodies for modulating neutrophil chemotaxis in immune response and wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Neutrophil cell chemotactic; wound healing; inflammation; vulnerary; antiinflammatory.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nerve regeneration; nerve cell proliferation; axon extension; treatment; central nervous system disorder; peripheral nervous system disorder; spinal disorder; head injury; cerebrovascular disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  peptide or its salt as the active component. The peptide and its salt can be used for covering injuries, promoting adhesion of biotissues, bone reinforcing and nerve regeneration. The present sequence represents a specifically claimed peptide of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a material for medical treatment which comprises one or more peptides of the formula XADEGJIMPTOQY, or their salts, immobilised on a substrate: where X = H, CH3CO or CH3COLys;
A = Ser or Th; D = Ile, Val or Leu; B = Lys or Arg; G = Ile, Val or Leu; J = Gly or Ala; L = Ile, Val or Leu; M = Gly or Ala; D = Gly, Ala or Gly-Lys-Lys-Lys-Gly; T = OH or NH2. Also described is an agent for cell growth promotion and/or cell adhesion promotion containing the above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Material for medical treatment comprises new peptide - used for covering injuries, promoting adhesion of bio-tissues, bone

neutrophil cell chemotactic agent. (I) has vulnerary and antiliflammatory activities. (I) is useful as a potent neutrophil cell chemotactic agent and for generating antibodies against the peptides, which are useful for modulating neutrophil recruitment to a wound site for enhancing or inhibiting inflammation and early effects of wound healing. Neutrophil response to (I) is specific, since monogytes and fibroblasts do not show any expression of the receptor to which (I) binds. The present sequence represents a human thrombin receptor bliding domain peptide which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to novel synthetic peptides and antibodies which are potent chemotactic agents for neutrophils. The peptides of the invention mimic the activity and role of the cleavage fragment of the proteolytically activated receptor for thrombin (PART). They are useful for stimulating or modulating neutrophil cell chemotactic migration or for generating an antibody. In particular, the peptides of the invention are useful for modulating neutrophil recruitment to a wound site for enhancing or inhibiting inflammation and early effects in wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  They are also useful for modulated neutrophil chemotaxis in immune response. The present sequence is high affinity receptor binding domain of human thrombin. This peptide is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New synthetic peptide neutrophil cell chemotactic agents, useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Stimulating growth and repair of cartilage, useful for treating e.g. arthritis, by local administration of an agonist of non-proteclytically activated thrombin receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of stimulating growth and repair of cartilage. The method involves administering to the site, an agonist of non-proteolytically activated thrombin receptor (NRRN). The method is used in human or veterinary medicine for the treatment of arthritic joints and damage/loss of cartilage caused by traumatic injury. Also chondrocytes may be cultured in presence of NRRR agonist to provide calls for implantation at sites requiring growth/repair of cartilage. The present sequence is human thrombin peptide derivative which serves
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention describes a method of stimulating bone growth at a site in a subject in need of osteoladuction. The method involves administering an agonist to stimulate bone growth at a site in a subject (e.g. a farm animal, companion animal or laboratory animal), in need of osteoladuction, such as the site in need of a bone graft in a subject, a segmental bone gap, a bone vid or a non-union fracture. This sequence represents a thrombin peptide derivative obtained from a serine esterase that can stimulate or activate the non-proteolytically activated thrombin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Stimulating bone growth at a site in a subject in need of osteoinduction, such as a site of bone graft, segmental bone gap, bone void or non-union structure, by administering agonist of activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 11; Page 22; 27pp; English

Thrombin-derived peptide used to promote cardiac tissue repair

01-MAY-2002 (first entry)

Thrombin; revascularisation; vascular occlusion; tissue repair; vulnerary; vasotropic; cardiant; angiogenesis; restenosis; therapy; human.

Homo sapiens

Promoting cardiac tissue repair, stimulating revascularisation, stimulating vascular endothelial cell proliferation, and inhibiting vascular occlusion by using anglogenic thrombin derivative peptide that includes a thrombin receptor binding domain sequence (see als AAM50856) and a serine esterase conserved sequence (see also AAM50857). The peptide is used in a claimed method for promoting cardiac tissue repair. It is administered during or following cardiac surgery by injection into cardiac tissue, and may be formulated as a sustained release formulation. The thrombin formulated as a sustained release formulation. The thrombin proliferation, stimulating vascular endothelial cell proliferation, inhibiting vascular endothelial cell restenois following balloon angioplasty, in which case it may be "serine esterase conserved sequence" /note- "thrombin receptor binding domain" 12..23 Location/Qualifiers Claim 4; Page 19; 24pp; English 12-JUL-2001; 2001WO-US21944 12-JUL-2000; 2000US-217583P (TEXA) UNIV TEXAS SYSTEM. coated onto the catheter. 12..23 /note= WPI; 2002-179665/23. 23 AA; WO200204008-A2. ```
CC an exosite assay has been developed for inhibition of the catalytic cleavage of prothrombin (PTh) to thrombin (Th) by prothrombinase (I), at a site remote from the catalytic site of (I) comprises: (a) preparing a colution containing 0.05-20 mu M substrate (S), that includes a protease cleavage site and exosite-binding determinant; 0.05-200 nM factor Va; 0.50-500 micro M phospholipids (PL); test inhibitor (A) in buffer of pH (CC 79, containing 1-10 mM calcium ions but no calcium-chelating agent; (CC 10) initiating catalytic cleavage of (S) by adding an aliquot of factor Xa (to final concentration 0.05-200 nM) so that there is an excess of va (CC Xa, forming a S(I) complex; (C) withdrawing aliquots of the creation mixture, quenching them; and (d) assaying for concentration of Th. Alternatively, in the initial solution S is replaced by the same concentration of Xa (less than the amount of Va), and reaction is started by adding S. Also described in the present invention are inhibitors (A) having ICSO less than 1 mu M identified by this assay. (A) are potentially useful as a new class of anticoagulants for treatment of cardiovascular disease, stroke and haematological disponders. The method is based on the finding that exosite interactions are critical for represents human zeta. 2 prethrombin 2.

The present sequence of the present sequence of the second parametric of the present sequence of the sequence of the second parametric of the present sequence of the sequence of the second parametric of the sequence of the second parametric of the present sequence of the sequence of the second parametric of the present sequence of the sequence of the second parametric of the present sequence of the sequence of the second parametric of the sequence of the
                                                  Exosite assay for agents that inhibit catalytic cleavage of prothrombin - at sites away from the active site of prothrombinase, also new inhibitors, potentially useful as anticoagulants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mutein; platelet aggregation; blood clotting;

                                                                                                                                                                                                                                                                                                                                                   An exosite assay has been developed for inhibition of the catalytic cleavage of prothrombin (PTh) to thrombin (Th) by prothrombinase (I), at a site remote from the catalytic site of (I) comprises: (a) preparing a solution containing 0.05-20 mu M substrate (S), that includes a protease cleavage site and exosite-binding determinant; 0.05-200 mM factor Va; 0.50-50 micro M phospholipids (PL); test inhibitor (A) in buffer of pH (7-9, containing 1-10 mM calcium ions but no calcium-chelating agent; (b) initiating catalytic cleavage of (S) by adding an aliquot of factor Xa (to final concentration 0.05-200 mM) so that there is an excess of Va over Xa, forming a S/(I) complex; (C) withdrawing aliquots of the caection mixture, quenching them; and (d) assaying for concentration of Xa (less than the amount of Va), and reaction is started by adding S. Also described in the present invention are inhibitors (A') having IC50 less than 1 mu M identified by this assay. (A') are concentration described in the present invention are inhibitors (A') having IC50 less than 1 mu M identified by this assay. (A') are cardiovascular disease, stroke and haematological disorders. The method is based on the finding that exosite interactions are critical for concentrate specificity in catalytic formation of Th. The present sequence concentrate specificity in catalytic formation of Th. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                    Exosite assay for agents that inhibit catalytic cleavage of prothrombin - at sites away from the active site of prothrombinase, also new inhibitors, potentially useful as anticoagulants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              exosite assay; anticoagulant; blood clot; thrombin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Prothrombin mutants having one or more changes in amino acid sequence compared with the natural protein and having 0.10% (preferably 0.0.25%) of the activity of the natural protein are claimed, provided that changes in amino acid sequence do not affect the capacity of the mutants to bind to specific ligands and receptors. The mutants have greatly reduced clotting activity and are useful as antagonists of thrombin inhibitors such as hirudin, heparin and anti-thrombin III. The mutations may also result in changes to the in vivo half-life of prothrombin. The half-life may be reduced to less than 10 minutes or the mutant prothrombin may have an extended half-life of more than
                                                                                                                                                                                                                                                                                                                        i hour, making it useful as an anticoagulant and to inhibit side-
effects of anti-coagulant treatment. They are converted to inactive
thrombin and are able to compete with native, active thrombin for
binding to receptors. The present sequence represents the thrombin
mutant which is derived by trypsin cleavage of a specifically
claimed human prothrombin mutant in which has at position 419 is
changed to Asn. The thrombin Asn99 mutant was found to have only
0.24% of the activity of wild-type thrombin on a chromogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (Note: This sequence does not appear in the specification and has been produced by modifying the wild-type sequence of human prothrombin which appears in figure 1).
                                                                  Prothrombin mutants with reduced clotting activity – useful as antagonists of thrombin inhibitors or for anticoagulant therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Thrombin; oligonucleotide-directed mutagenesis; procoagulant; anticoagulant; protein engineering; ss.

The sequence reresents wild-type (reference) thrombin. Mutants of this sequence (AAR74776-80 and AAR76033-41) have at least 80% homology with thrombin, and are capable of protein-c activation without significant fibrinogen clotting activity, and vice versa clotting activity of less than 0.5 or greater than 2 compared to thrombin. The mutant thrombin sequences, produced in recombinant conditions on by in vitro methods, and are used to treat thrombotic conditions, particularly during cardiac bypass surgery and in cases of septic shock.
                                                                                                Thrombin derivs with segregated pro- and anticoagulant activities useful for treating thrombotic disorders but also diagnosis,

Thrombin derivs with segregated pro- and anticoagulant activities

(GILE-) GILEAD SCI.

ö

Gaps

useful for treating thrombotic disorders but also diagnosis, treatment of tumours, etc.

Claim 22; Page 63/3; 78pp; English.

The mutant thrombin sequence, generated by oligonucleotide-directed mutagenesis, has at least 80% homology with thrombin, and is capable of protein-C activation without significant fibrinogen clotting activity, and vice versa. (specifically, it has a ratio of protein-C activity to fibrinogen clotting activity of less than 0.5 or greater than 2 compared to thrombin). The mutant thrombin is produced in recombinant cell culture or by in vitro methods, and is used to treat thrombotic conditions, particularly during cardiac bypass surgery and in cases of septic shock.

-I. THOMALIN. THROMBIN, WHICH CLEAVES BONDS AFTER ARG & LYS, CONVERTS FIBRINGEN TO FIRSHIN AND ACTIVATES FACTORS V, VII, VIII, XIII, AND. IN COMPLEX WITH THROMBOMODULIN, PROTEIN C.

-I. CATALYIC ACTIVITY: Preferential cleavage: Arg-1-Gly; activates fibrinogen to fibrin and releases fibrinopeptide A and B.

-I. SUBCELLULAR LOCATION: Extracellular.

-I. SUBCELLULAR LOCATION: Extracellular.

-I. PTW: THE GAMA-CARBOXYGLUTAMYL RESIDUES, WHICH BIND CALCIUM IONS, RESULT FROM THE CARBOXYGLUTAMYL RESIDUES BY A MICROSOMAL ENTYME, THE VITAMIN K-DEPENDENT CARBOXYLASE. THE MODIFIED RESIDUES ARE NECESSARY FOR THE CA-DEPENDENT INTERACTION WITH A NEGATIVELY CHARGED PHOSPHOLIPID SURFACE, WHICH IS ESSENTIAL FOR THE CONVERSION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MISCELLANEOUS: IT IS NOT KNOWN WHETHER 1 OR 2 SMALLER ACTIVATION PEPTIDES, WITH ADDITIONAL CLEAVAGE AFTER 314-ARG, ARE RELEASED IN NATURAL BLOOD CLOTTING.

MATURAL BLOOD CLOTTING.

MISCELLANEOUS: THROMBIN CAN ITSELF CLEAVE THE AMINO TERMINAL FRAGMENT (FRAGMENT 1) OF THE PROTHROMBIN, PRIOR TO ITS ACTIVATION BY FACTOR XA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MISCELLANGOUS: PROTHROMBIN IS ACTIVATED ON THE SURFACE OF A PHOSPHOLIPID MEMBRANE THAT BINDS THE AMINO END OF PROTHROMBIN & PACTORS AS & XA IN CA-DEPENDENT INTERACTIONS; FACTOR XA REMOVES THE ACTIVATION PEPTIDE & CIEAVES THE REMAINING PART INTO LIGHT & HEAVY CHAINS.
